the solutions to each problem are written from a first principles approach which would further
 augment the understanding of the important and recurring concepts in each chapter moreover the
 solutions are written in a relatively self contained manner with very little knowledge of
 undergraduate mathematics assumed in that regard the solutions manual appeals to a wide range of
 readers from secondary school and junior college students undergraduates to teachers and professors

safe and efficient joints are key for improving the structural efficiency of composite aircraft therefore this thesis investigates the potential of multifunctional bondlines combining structural bonding disbond arrest features and structural health monitoring the central research question is how to achieve a functionally compliant design this means ensuring disturbances between these functions do not eliminate their benefits regarding the objective of safe and efficient joints the approach is adding discrete multifunctional disbond arrest features functionally integrating disbond arrest and sensor functions to epoxy bondlines experimental results indicate some major challenges such as a stiffness conflict for the integrated functions nevertheless securing the epoxy bondline without disturbing its static strength proves successful in the end in addition the thesis provides some new insights regarding the functional compliance concept for example it strongly suggests considering temporal aspects such as transient material properties
